Card anatomy & content rules

Heading → status → primary value → supporting context → action. Let card height hug content and align sibling widths with Auto Layout.

Always show units | Use timestamps | Label status

Medication "Taken" is a recorded state, not an instruction. Reference ranges come from the patient's care plan. Do not infer a diagnosis from a reading.

Card states / when data is unavailable

Preserve the card's purpose. Never substitute a zero for missing clinical data.

No upcoming appointments
